Pulse-Jet Baghouse Overview & Common Problems

Joe Haney

imagination at work

Utility Hot Gas Market APC Trends

In the past 5 years, the trend is moving to Pulse Jet collectors (approximately 60% of applications):

- Felt used for under 400°F (205°C)
- 3:1 - 4:1 Air-to-Cloth ratio
- 3 – 6 year filter life
- Smaller housing footprint

Municipal Solid Waste Incineration
16 MW – 65,000 ACFM

Coal-fired Industrial Boiler
110,000 ACFM

Utility Boiler
500,000+ ACFM

GE Proprietary 2

Hot Gas Pulse Jet Design Trends

	Pulse Pressure	Cage Type	Maximum Length	Fabric Selection	Relative Energy Usage	Issues
Traditional PJ High Pressure / Low Volume	60 - 100 PSI (4.1 – 6.9 Bar)	One-Piece	16 – 19 feet (4.9- 5.8m)	Any	★★★	Housing Footprint
Medium Pressure / Medium Volume	25 – 50 PSI (1.7 – 3.4 Bar)	Multi-Piece	22 – 25 feet (6.7 – 7.6 m)	Felt	★★★	Cage wear; Penthouse restrictions
High Volume / Low Pressure	< 15 PSI < 1 Bar)	Multi-Piece	22 – 27 feet (6.7 – 8.2 m)	Felt	★★★	Cage wear; Penthouse restrictions

Air-to-Cloth Ratios:

3:1 – Fiberglass

3.5:1 – Fiberglass with PTFE membrane

4:1 - Felt

GE Proprietary 3

Fabric Selection Considerations

- Baghouse Operating Temperature
- Abrasion Resistance Needed
- Resistance to Cleaning Energy
- Gas Stream Chemistry
- Air-to-Cloth Ratio

GE Proprietary 4

Fabric Characteristics & Suitability for Power Generation Applications

	Polypropylene	Polyester	Acrylic	Fiberglass	Aramid	PPS	P84 ***	Teflon® ***

** Sensitive bag-to-cage fit*

*** Fair with chemical or acid-resistant finishes*

**** Must oversize bag for shrinkage for temperatures above 450°F (232°C)*

GE Proprietary 5

Commonly Used Filtration Fabrics Pulse Jet & Low Pressure - High Volume

- Woven fiberglass – 25%
- PPS (Polyphenylene Sulfide) – 60%
- Acrylic – 10%
- Others – 5%
  - P84
  - ePTFE Membrane applied to the above substrates
  - Pleated Filter Elements (PFEs)

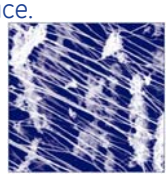
GE Proprietary 6

What is ePTFE Membrane?

A microporous membrane laminated to traditional filtration fabrics.

The PTFE membrane consists of a web of overlapping fibrous strands that form millions of air passages, much smaller than the particulate, for an extremely porous filter surface.

Because the membrane is slick, bag cleaning is more complete with less energy.



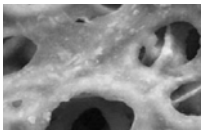
Microphotograph of membrane

Why is ePTFE gaining popularity for filtration?

- Enhanced fine particulate collection
- Superior clean-down of the filter
- Lower differential pressure
- Resistance to moisture in the gas stream
- Longer bag life

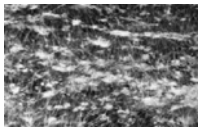
ePTFE membrane vs. coatings

Coated filtration medias allow for much larger voids in the fabric while reducing clean fabric permeability as much as 25%



Coated Polyester Felt at 1000x
Large pores allow submicron dust to pass through

Membrane provides a microporous web structure that traps submicron particulate while maintaining consistently higher airflows



ePTFE on Polyester Felt at 1000x
microporous structure ensures maximum efficiency

Solutions with pleated elements

Increase surface filtration area...
by as much as 2–3 times

Lower differential pressure...
increased airflow

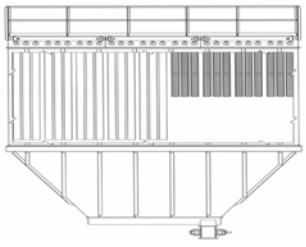
Lower emissions...
double filtration efficiency

Solutions with BHA ThermoPleat® technology:

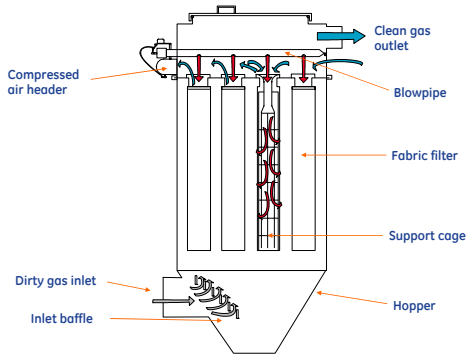
Shorter Filters are installed out of the inlet gas stream:

Reduces abrasion to bottom of filters.

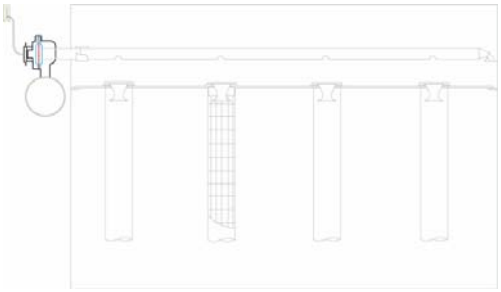
Provides for a large drop-out zone.



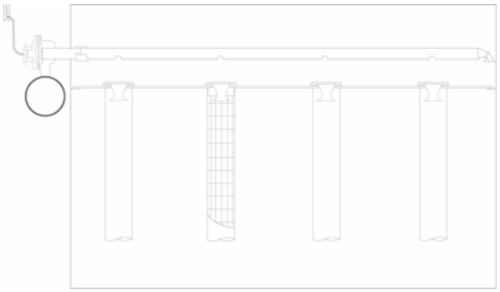
Typical pulse-jet collector



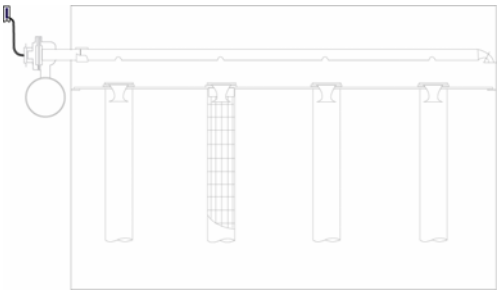
Diaphragm valve



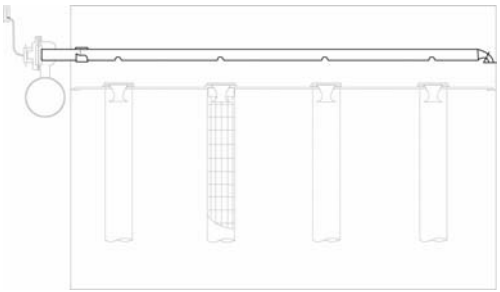
Manifold



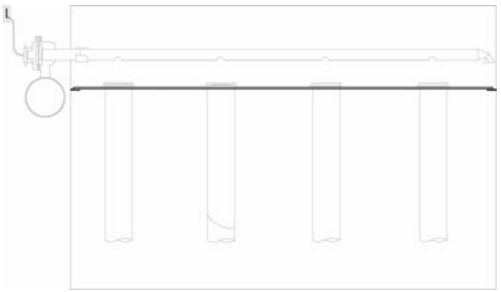
Solenoid valve/bleeder tube



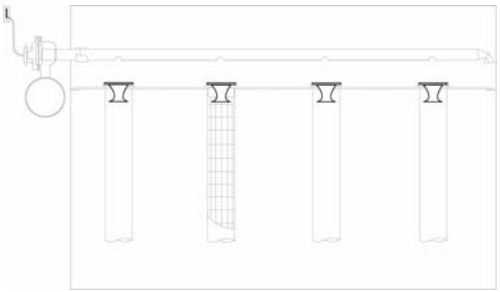
Blowpipe



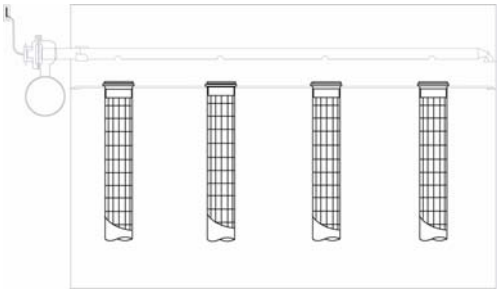
Tubesheet (cell plate)



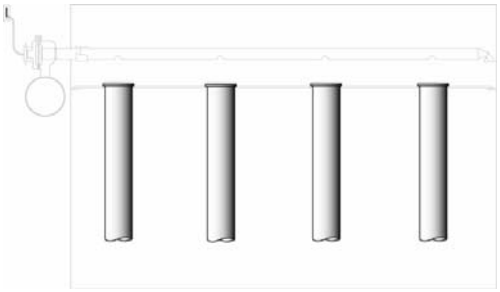
Venturis

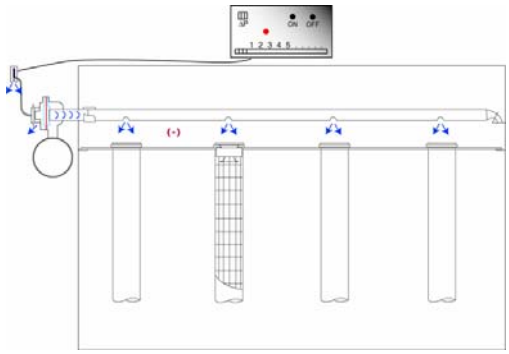


Cages



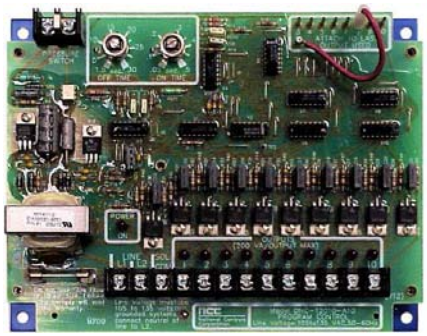
Bags

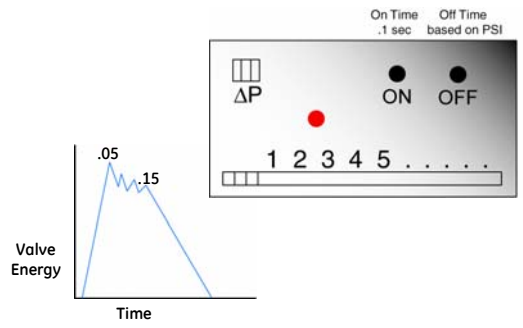




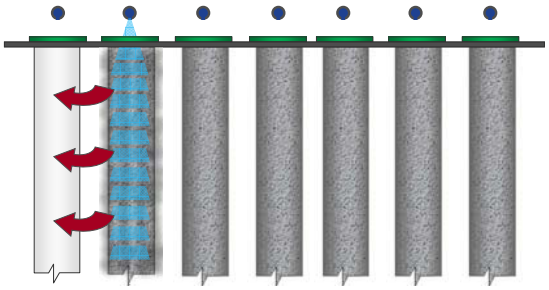
Clean-on-Demand system

High-Low set points at no greater than 1" apart...
Ideal is no more than 0.5"



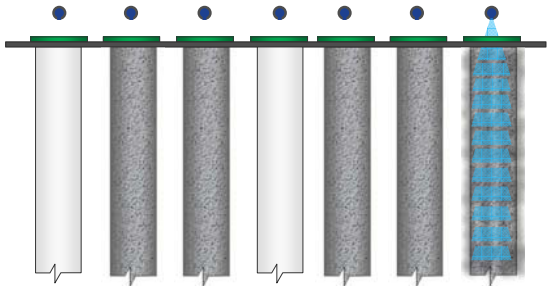


Incorrect pulse cleaning sequence

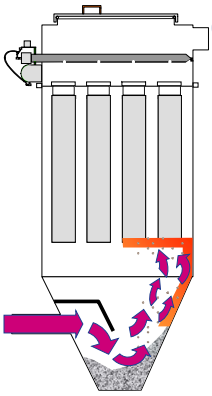


GE Proprietary 25

Correct pulse cleaning sequence



GE Proprietary 26



Common Inlet Design

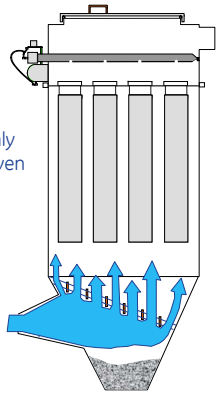
- Inlet baffle directs airflow down into hopper.
- Collected material can swirl upward, causing heavier than design grain-loading.
- Narrow hoppers and nearby bag bottoms may experience abrasion damage.

GE Proprietary 27

imagination at work

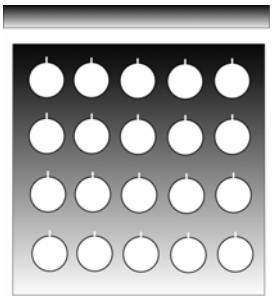
Improved design

- Enlarged inlet reduces velocity.
- "Ladder Vane Baffles" more evenly distributes airflow, reducing uneven grainloading and turbulence.
- The baffles are simple and economical to install.



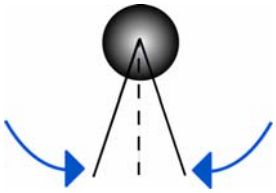
GE Proprietary 29

Blowpipe manifold/bag seam alignment

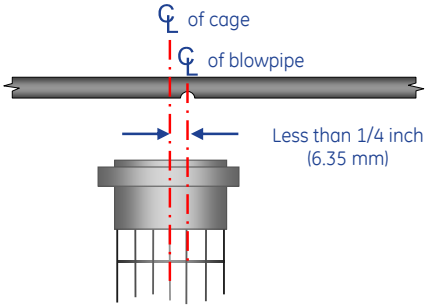


GE Proprietary 30

Blowpipe alignment



Blowpipe misalignment



Six ways dust gets to clean air plenum

- Hole in bag
- Snapband
- Leak around a weldment
- Clean too soon
- Not cleaning
- Air leaks at door seal

Inspection and maintenance procedures

Daily Maintenance

1. Check pressure drop
2. Check cleaning system
3. Check all valves and dampers
4. Check dust removal
5. Check emissions
6. Do a daily walkthrough
