# Simple Cycle Gas Turbine SCR

# Cogeneration Gas Turbine SCR

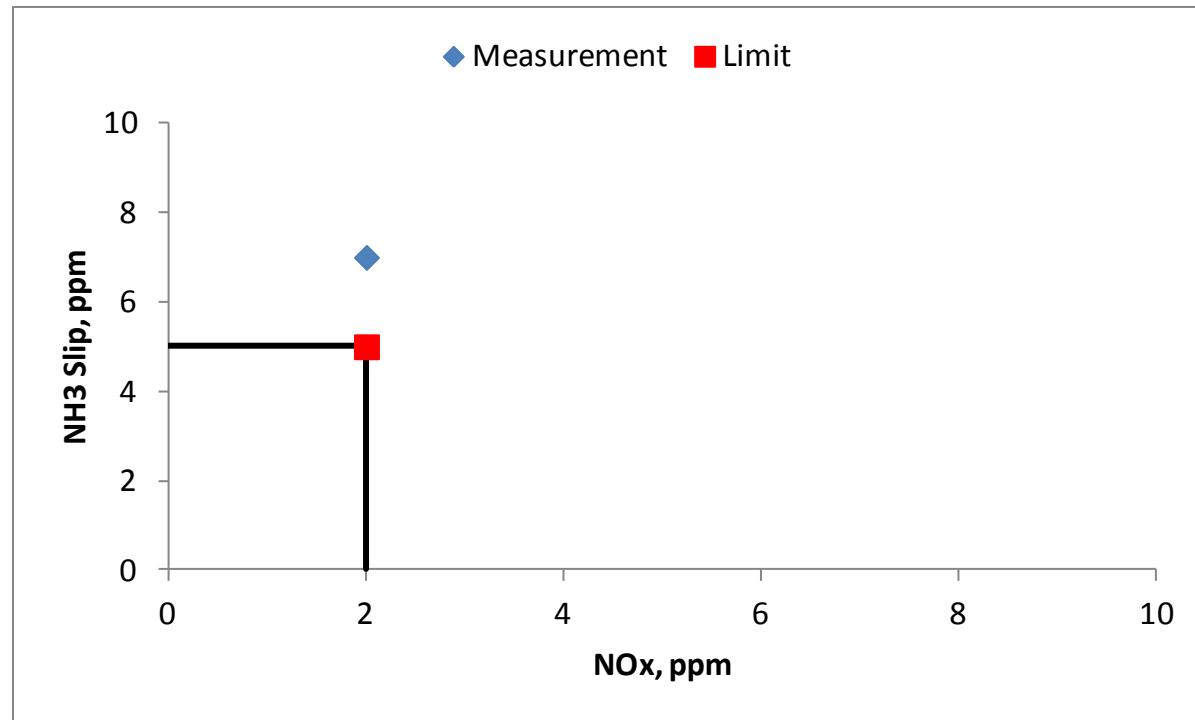

# Optimizing Gas Turbine SCR Performance

## Topics

- **Troubleshooting - How to Distinguish  $\text{NH}_3$  Maldistribution from Bypass**
- **AIQ Tuning - Catalyst Inlet  $\text{NH}_3/\text{NO}_x$  Distribution**
- **Identifying Flue Gas Bypass**
- **Catalyst Management/Measuring Catalyst Activity**

# What Can Lead to Non-Compliance: NH<sub>3</sub>/NO<sub>x</sub> Maldistribution, Bypass?

# Stack NH<sub>3</sub> vs. NO<sub>x</sub>

## NH<sub>3</sub>/NO<sub>x</sub> RMS Effects

## Bypass Effects

## A simple stack test can distinguish

- NH<sub>3</sub> Maldistribution
- Flue Gas Bypass

# Stack NH<sub>3</sub> vs. NO<sub>x</sub>

## NH<sub>3</sub>/NO<sub>x</sub> RMS Effects

## Bypass Effects

# Stack NH<sub>3</sub> vs. NO<sub>x</sub>

## NH<sub>3</sub>/NO<sub>x</sub> RMS Effects Effects

## Bypass Effects

## How to best generate this data?

- Wet Chemical NH<sub>3</sub> measurements?
- Continuous NH<sub>3</sub> measurements?

# TDL Instrumentation

- Testing facilitated using a continuous TDL  $\text{NH}_3$  analyzer
- Data set can be generated in less than a day
- Data available in real time

- Unisearch  $\text{NH}_3$  TDL
  - Dual Path
  - Two Channel
  - Fiber Optic Coupled

# NH<sub>3</sub>-TDL Lines of Site

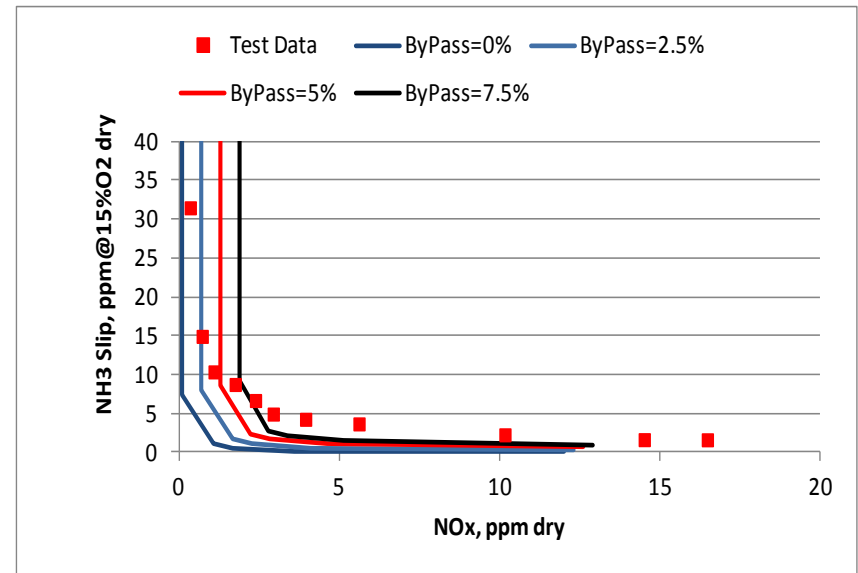

# TDL NH<sub>3</sub> Measurements on a Large Combined Cycle

## NH<sub>3</sub>/NO<sub>x</sub> RMS Effects

## Bypass Effects

# ALG Tuning

# Gas Turbine SCR AIG Tuning

- **Tuning is Facilitated by Installing a Permanent Sample Grid at the Catalyst Exit:**
  - **Not feasible to manually traverse a large combined cycle system for AIG tuning**
  - **Typically need 36 to 60 probes depending on AIG design**
- **With Permanent Probes Tuning can Typically be done in One Day**
- **The NO<sub>x</sub> Profiles at the Exit of the Catalyst can also Help Identify Bypass**

# NH<sub>3</sub>/NO<sub>x</sub> Distribution and AIG Tuning

New Catalyst

Catalyst Near End-of-Life

# How Well is Your AIG Tuned? (As Found RMS Values)

Most of the GT AIGs we encounter are not tuned very well!

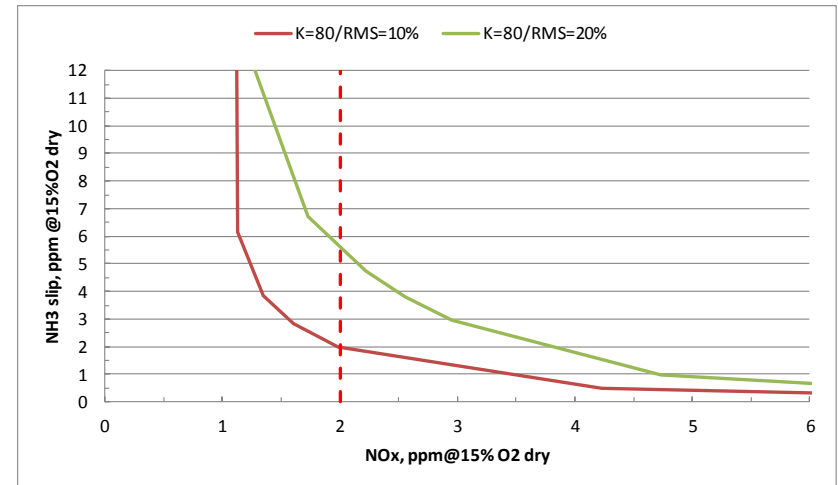

# How Important is the $\text{NH}_3/\text{NO}_x$ Distribution?

- SCAQMD is pushing  $\text{NO}_x$  from 5 to 2 ppm in So. Cal.
- Assumption is that just adding more catalyst will be the solution

## RMS=20% Add Catalyst

## Tune AIG To RMS=10%

- Just tuning the AIG allows 2 ppm  $\text{NO}_x$  to be achieved
- Adding 50% more catalyst helps, but not as much as tuning

# Catalyst Management

# Catalyst Management

- Tracking catalyst activity and  $\text{NH}_3/\text{NO}_x$  distribution
- Ensure continued environmental compliance
- Plan for catalyst replacements

# Catalyst Management

Catalyst management for a combined cycle SCR system entails tracking key parameters so you know when the catalyst must be changed.

These Parameters are:

1. Catalyst Activity (K, m/hr)
2. Reactor Potential (RP, dimensionless)

# Catalyst Activity

- **Catalyst Activity** determines how well a catalyst is performing regarding  $\text{NO}_x$  reduction.
- **Typical poisons in a combined cycle SCR include sodium and phosphorous.**
  - **Na:** GT water injection, water for aqueous  $\text{NH}_3$  production, ambient sources (ocean air).
  - **P:** GT lube oil

# Reactor Potential

- Although catalyst activity is important, the key parameter for determining SCR performance is the reactor potential RP.
- RP is essentially the activity multiplied by the total catalyst surface area per unit of exhaust gas.

$$RP = \frac{(K)(A_{\text{surface}})}{Q} = \frac{K}{A_v}$$

- RP is important because it reflects the effects of both catalyst activity and area velocity.

# Catalyst Activity

- **Laboratory activity measurements historically has been a key step in catalyst management**
- **Until recently there were no standard testing guidelines for GT SCR or CO catalyst. This led to variations among laboratories.**
- **EPRI recently released a Guideline for testing Gas Turbine SCR and CO catalyst**
- **Available at the EPRI Website (Report 3002006042)**

# EPRI GT SCR/CO Testing Guidelines

- Developed by an industry consortium
- SCR Catalyst: Outlines Standardized Test Methods
  - Activity, K
  - $\Delta\text{NO}_x$  @  $\text{NH}_3$  slip limit
- CO Catalyst
- Chemical and Physical Analysis

# Measure RP Insitu

- While sending samples to a lab for activity measurements historically has been a key step in catalyst management, it is no longer necessary.
- Today an owner operator can take control of catalyst management with the CatalysTraK<sup>®</sup>, a system that measures catalyst activity and RP in-situ.
- Insitu tests are performed at actual full scale operating conditions
- Tests can be conducted at any time, no outage required
  - Performed during an annual compliance test
  - At any time there may be an issue with catalyst performance
- Applicable to both NO<sub>x</sub> and CO catalyst

# CatalysTraK<sup>®</sup> System Components

Similar to the lab approach for SCR catalyst, NO<sub>x</sub> reduction is measured across a small cross section (test section) of the catalyst bed. A small supplemental ammonia injection grid (AIG) is permanently mounted upstream of the test section.

# CatalysTraK<sup>®</sup> System Components

Additionally, an inlet gas sampling probe is installed directly upstream of the AIG, and an outlet gas sampling probe is installed immediately downstream of the catalyst bed at the test section. The supplemental AIG is used to increase the  $\text{NH}_3/\text{NO}_x$  level and provide excess ammonia across the catalyst test section.

The RP calculation then is based on the maximum  $\text{NO}_x$  reduction measured across this catalyst test section.

# CatalysTraK<sup>®</sup> Supplemental Injection Grid

Supplemental injection grids located upstream of both CO and NO<sub>x</sub> Catalysts.

# CatalysTraK<sup>®</sup> Access Ports on a Small Combined Cycle

**CO Measurement Access Ports**

# CatalysTraK<sup>®</sup> History

CatalysTraK<sup>®</sup> was originally developed for coal-fired SCR's. These systems are characterized by multiple catalyst layers.

# CatalysTraK<sup>®</sup> Application to Turbines

**One issue related to the application of CatalysTraK<sup>®</sup> to a GT SCR is that these systems have a single layer of catalyst and it contains all of the reactors RP.**

**Thus when the catalyst is relatively new, the measured NO<sub>x</sub> reduction across a layer of GT catalyst can be greater than 99%. This can make it difficult to accurately determine the reactor potential RP.**

# CatalysTraK<sup>®</sup> Application to Turbines

The bottom line: Early in a catalyst's life, the CatalysTraK<sup>®</sup> measurement may have a higher degree of uncertainty associated with RP, but at that point in the catalyst's lifecycle it is not critical that the RP be precise. *This is also an issue in laboratory testing of new GT SCR catalyst!*

# CatalysTraK<sup>®</sup> Reactor Potential Results

CatalysTraK<sup>®</sup> tests run over two years show the RP is well above the minimum level required.

# CO Catalyst Testing

As with SCR catalyst, CO catalyst performance also degrades over time. Historically core samples are drilled out or pulled from test panels and tested in a lab. The test involves just measuring the amount of CO oxidation that occurs across the sample, while simulating full-scale temperature and space velocity.

*Why not just measure the oxidation across the actual CO catalyst bed while it is operating?*

# CatalysTraK<sup>®</sup> CO Catalyst Test Results

The tests run over two years show CO oxidation rates of between 96% and 98%.

# Summary

- Simple stack measurements ( $\text{NH}_3$  vs  $\text{NO}_x$ ) can distinguish **Gas Bypass** from  **$\text{NH}_3/\text{NO}_x$  maldistribution**
  - Facilitated by using a continuous TDL analyzer to make the  $\text{NH}_3$  measurements
- **ALG tuning facilitated using a permanent probe grid at the catalyst exit**
  - With a probe grid and multipoint sampling, ALG tuning completed in one day
- **ALG Design affects how well a unit can be tuned**
- $\text{NO}_x$  profiles at the SCR outlet can also help diagnose areas of **Gas Bypass**

## Summary (Continued)

- Historically, lab tests have been used to monitor the performance of both SCR and CO catalysts over time.
- EPRI recently released GT SCR/CO testing guidelines **(Report 3002006042)**
- Recent tests showed both SCR and CO catalysts can easily be characterized in-situ.
- The in-situ technique is simple.
- It can be done easily during the annual compliance test, does not require an outage, and provides an opportunity to obtain a more comprehensive data set.
