

# REINHOLD ENVIRONMENTAL<sup>®</sup>

## **2024 Reinhold/PCUG Round Table Presentation**

Hosted by LG&E/KU and Co-hosted by Southern Co. and TVA  
in The Marriott Resort Lexington Griffin Gate Hotel, Lexington,  
KY on June 24-25, 2024

# Gas Profile Survey

Operating Characteristics of the SCR

## Types of Mixing Systems

- Straight Line - Devices straighten flow, intensive grid to match NO<sub>x</sub> profile
- Shifting Mixers - Devices alternately shift gases horizontally and vertically, NH<sub>3</sub> injected through one or more multi-nozzled header.
- Zonal Mixers - Devices divide duct into zones with intensive mixing, NH<sub>3</sub> adjusted for each zone.
- Vortex Mixers - Devices create vortices throughout duct, NH<sub>3</sub> injected into a vortex device.

## What is NH<sub>3</sub> System Balancing?

- Adjusting the NH<sub>3</sub> injection so that the NH<sub>3</sub> profile in the SCR matches the NO<sub>x</sub> profile sent to the SCR from the combustion source.
- This is accomplished by measuring the residual outlet NO<sub>x</sub> of the SCR, then adjusting the NH<sub>3</sub> injection valves until the residual outlet NO<sub>x</sub> is as even as possible.

## Why Balance Your NH<sub>3</sub> Injection?

- Achieve best NH<sub>3</sub> to NO<sub>x</sub> ratio possible
- This gives highest potential for removal of NO<sub>x</sub>
- Most efficient use of NH<sub>3</sub> to meet target NO<sub>x</sub> levels
- Lowest amount of NH<sub>3</sub> slip
- Most room for control swings
- Assists with trouble shooting down the road

## Know Your SCR System Before You Start

What are the strengths and weaknesses of the SCR system?

Does the NO<sub>x</sub> to the SCR have a consistent profile?

How much flexibility is there to make adjustments?

Is there adequate coverage with test ports?

Are the sample probes in good condition?

How finely tuned are the controls?

Where's the closest restroom and what is the approximate time to get there?

# Typical Setup

One analyzer per port, plus one reference analyzer per grid (9 analyzers for largest reactors when doing outlet only)

All analyzers "daisy chained" and connected to a laptop

6 segments for each test

- 1 segment for each of the 5 probe depths
- A relative accuracy test at the end

# Probe Repair

[Back](#)

Modify 4" pipe sleeve inside hopper as shown

Cut off end of 4" pipe sleeve square

Weld in drilled and tapped insert

Install bulkhead fittings inside duct and install new sample tubing

Eliminate center T/C tubing

**Outlet NOx sample grid repair utilizing existing 4" pipe sleeves**
